

**ABSTRACT OF THE DISCLOSURE**

**A Healthcare Management System**

A healthcare management system integrates medical practitioners, healthcare administrators, patients and educators/students. Patient data is stored in a repository as clinical data with associated patient data. The clinical data is available for medical practitioners, educators and students without the patient data. The system is structured as an application layer accessed by user terminals and separated from the repository by a data access layer which stores details of where, and in what format, data is stored.
